

## FIELD CROP DATA 1967 - 1971

### FLORIDA CROP AND LIVESTOCK REPORTING SERVICE

Joe E. Mullin, Agricultural Statistician in Charge  
1222 Woodward Street  
Orlando, Florida 32803

### ACKNOWLEDGEMENTS

The publication of this bulletin is made possible through the efforts and cooperation of many individuals as well as private and governmental institutions. To all of them the Florida Crop and Livestock Reporting Service wants to express its appreciation.

Many farmers and agricultural enterprises have voluntarily supplied information to develop these statistics. The Agricultural Stabilization and Conservation Service has been a source of much basic data on crops under U. S. D. A. programs. Others contributing information were the Florida Department of Agriculture, Agricultural Experiment Stations and Cooperative Extension Service.

This bulletin is published by the Florida Crop and Livestock Reporting Service, a cooperative agency of the Statistical Reporting Service, U. S. D. A., Florida Department of Agriculture; and Florida Agricultural Experiment Station. Acreage, production, and value data are official statistics prepared by the Florida Crop and Livestock Reporting Service.

Tobacco, Type 14, 1968-1970 . . . . .	7

## INTRODUCTION AND COMMENTS

This publication, released annually, contains State-wide estimates of acreage, production and value of major field crops grown in Florida for the years 1967 through 1971. If anyone is interested in State estimates prior to 1967, they can receive upon request the "Field Crops Summary, 1919-1967." This historical bulletin contains State estimates from 1919 through 1966 or from the time earliest estimates were begun for particular crops. Crops for which estimates were started after 1919 are: soybeans in 1949, sugarcane in 1928, flue-cured tobacco in 1923, and wheat in 1958.

This year's publication contains county estimates of acreage, yield per acre and production for corn and wheat for the years 1969-71; peanuts, soybeans and flue-cured tobacco for the years 1968-70. County estimates for 1971 for peanuts, soybeans and tobacco were not available at publication but will be available upon request early in the summer. In addition to historical reports, the Crop and Livestock Reporting Service issues many reports on current conditions during the year. In March, a report on farmers' intentions to plant is released in each State. In July, estimates of current acreages are made. Forecasts of expected production are made during the growing season. All of these publications are available to the public on request.

Crop estimates are designed to aid farmers, buyers and sellers, government officials, research workers and others in agriculture in keeping abreast of current changes and in appraising future prospects in the light of past experience. It represents a part of the Department of Agriculture's continuing program to provide comprehensive data as a background for making analyses of the different segments of agriculture.

Agriculture is Florida's most important industry and has recorded phenomenal growth and changes in recent years. Because of the growth, changes and its relationship to the National picture, production and marketing information have become a necessity for conducting agricultural business. It is hoped the information in this publication will be of use to you in running your farm or business operation.

The past season was a good year for field crops. Record yields were made for cotton, hay, oats, peanuts, and shade-grown tobacco. The yield per acre for other field crops was good. It was the first good corn crop in four years. With the exception of corn and oats, prices received by the growers were high when compared with other recent years.

Sugarcane continues to be by far the highest value field crop in Florida. The preliminary estimate places the value of the 1971-72 sugarcane crop at \$76,141,000 or a value of \$373 per acre. This year's crop has the highest value of production of any year. It was not the largest production but rise in prices since the record production in 1964 accounts for the greater

value. The yield of 31 tons per acre was low when compared to other recent years. Repeated freezes affecting the young cane reduced yields. Acreage has increased during the past two years and will be larger during the current growing season.

Peanuts for the first time in recent years had more value than flue-cured tobacco. This was partially due to increase in peanut acreage and a small decline in tobacco acreage. The main factor was the tremendous increase in average yield per acre of peanuts. Farmers enjoyed a yield of 2,400 pounds of peanuts per acre in 1971 compared with 2,075 pounds in 1970, and a high of 1,680 pounds prior to that time. The main reason for the high yield was the switch to a high yielding variety as well as good cultural practices. Another factor during the past season was rains in late summer delaying harvest until the nuts were fully mature and had reached maximum size. The price has increased in each of the past four years. Peanut acreage is controlled and no further acreage increase is expected.

Flue-cured tobacco with a yield per acre of 1,980 pounds, the second highest on record, declined over two million dollars in value to \$16,207,000. The main reason was a 13 percent decrease from the previous year's acreage to only 10,700 acres in 1971. Cool weather in the early portion of the growing season lowered yield prospects.

Shade-grown tobacco (cigar wrapper) continued its usual annual acreage decline. In the combined Florida-Georgia area only 3,000 acres were grown in 1971. Over twice this acreage was harvested in 1965.

Florida had its first good corn crop since 1947. The year 1970 was a disaster year due to the Southern Corn Leaf Blight and the two previous years were affected by drought. Corn acreage continues its decline in Florida.

Soybeans continued their increase in importance in Florida. They ranked fourth in value in 1971. This is significant when considering that most of the beans are produced in the western portion of the Panhandle. During the past 10 years the acreage has gone from 40,000 to 207,000 acres. It more than doubled in each of the five year periods. Thus far, 28 bushels per acre has been the highest State-wide average yield in Florida. Much of the acreage is concentrated in large plantings per farm or firm. Harvest last fall was completed later than normal due to rains.

Cotton yield per acre was the highest on record for Florida this past season. Acreage shifts from low producing to high yielding areas are a major factor in increased production. Cotton growing is rapidly shifting to Santa Rosa County. Total acreage grown in Florida continues to decline each year. Only 9,200 acres were harvested in 1971.
